100MHz Current Feedback Amplifier

3

 OPERATIONAL
AMPLIFIERS

Features

- This Circuit Is Processed in Accordance to MIL-STD-883 and is Fully Conformant Under the Provisions of Paragraph 1.2.1.
- Slew Rate 1000V/ μ s (Min)
1200V/ μ s (Typ)
- Output Current ± 80 mA (Min)
 ± 100 mA (Typ)
- Drives ± 8.0 V into 100Ω (Min)
 ± 9.5 V into 100Ω (Typ)
- V_{SUPPLY} ± 5 V to ± 18 V
- Thermal Overload Protection and Output Flag
- Bandwidth Nearly Independent of Gain
- Output Enable/Disable

Applications

- Unity Gain Video/Wideband Buffer
- Video Gain Block
- High Speed Peak Detector
- Fiber Optic Transmitters
- Zero Insertion Loss Transmission Line Drivers
- Current to Voltage Converter
- Radar Systems

Description

The HA-5004/883 current feedback amplifier is a video/wideband amplifier optimized for low gain applications. The design is based on current-mode feedback which allows the amplifier to achieve higher closed loop bandwidth than voltage-mode feedback operational amplifiers. Since feedback is employed, the HA-5004/883 can offer better gain accuracy and lower distortion than open loop buffers. Unlike conventional op amps, the bandwidth and rise time of the HA-5004/883 are nearly independent of closed loop gain. The 100MHz bandwidth at unity gain reduces to only 65MHz at a gain of 10. The HA-5004/883 may be used in place of a conventional op amp with a significant improvement in speed power product.

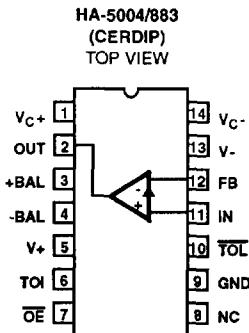

Several features have been designed in for added value. A thermal overload feature protects the part against excessive junction temperature by shutting down the output. If this feature is not needed, it can be inhibited via a TTL input (TOI). A TTL chip enable/disable (\bar{OE}) input is also provided; when the chip is disabled its output is high impedance. Finally, an open collector output flag (TOL) is provided to indicate the status of the chip. The status flag goes low to indicate when the chip is disabled due to either the internal Thermal Overload shutdown or the external disable.

In order to maximize bandwidth and output drive capacity, internal current limiting is not provided. However, current limiting may be applied via the V_C+ and V_C- pins which provide power separately to the output stage.

NOTES:

- Inverting (FB) input is a low impedance point; Bias Current and Offset Current are not specified for this terminal.
- DC Voltage Gain = $\frac{1}{\text{Gain Error}}$, for all Gain Error conditions.
- DC Transimpedance = $\frac{R_F}{\text{Gain Error}}$, $R_F = 250\Omega$, for all Gain Error conditions.
- Please refer to the Truth Table in the Applications Information section.

NOTES:

1. Parameters listed in Table 3 are controlled via design or process parameters and are not directly tested at final production. These parameters are lab characterized upon initial design release, or upon design changes. These parameters are guaranteed by characterization based upon data from multiple production runs which reflect lot to lot and within lot variation.
2. Measured between 10% and 90% points.
3. Full Power Bandwidth guarantee based on Slew Rate measurement using $Fpbw = \text{Slew Rate}/(2\pi V_{PEAK})$.
4. Power Consumption based upon Quiescent Supply Current test maximum.
