

## 1. DESCRIPTION

These latches are ideally suited for use as temporary storage for binary information between processing units and input/output or indicator units. Information present at a data(D) input is transferred to the Q output when the enable remains high. When the enable goes low, the information (that was present at the data input at the time the transition occurred) is retained at the Q output until the enable is permitted to go high.

The 'LS75 feature complementary Q and  $\bar{Q}$  outputs from a 4-bit latch, and are available in various 16-pin packages.

These circuits are completely compatible with all popular TTL families. All inputs are diode-clamped to minimize transmission-line effects and simplify system design. Series 74LS devices are characterized for operation from 0°C to 70°C.

NOTE 2:I<sub>CC</sub> is measured with all R inputs grounded,all S inputs at 4.5V, and all outputs open.
