HX65HVD251-S CAN Bus Transceiver

General Description

The HX65HVD251-S serves as the intermediary between the Controller Area Network (CAN) protocol controller and the physical bus, primarily designed for high-speed applications in passenger cars, with a maximum speed of up to 1 MBaud. It facilitates differential transmission to the bus and differential reception for the CAN controller.

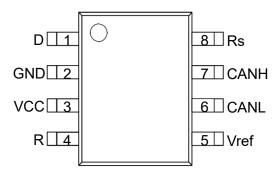

Features

- Operating voltage range: VCC = 5V \pm 10%
- Fully compliant with the ISO 11898 standard
- High-speed operation (up to 1 MBaud)
- Transceiver disengages from the bus in unpowered state (zero load)
- At least 110 nodes can be connected
- Very low-current standby mode with remote wake-up capability via the bus
- Differential receiver with high common-mode range for ElectroMagnetic Immunity (EMI)
- Transmit Data (D) dominant time-out function
- Bus pins protected against transients in automotive environments
- Thermally stabilized

Applications

- Automotive electronics
- Security systems
- Industrial control automation
- Intelligent instrumentation
- Building automation systems
- Road traffic control automation
- Point-to-point and point-to-multipoint communications
- Level converter
- Serial servers

PIN CONFIGURATIONS AND FUNCTIONS

| | Pin Descriptio | | | | | |
|-----|----------------------|---|--|--|--|--|
| Pin | n SYMBOL Description | | | | | |
| 1 | D | transmit data input | | | | |
| 2 | GND | ground supply | | | | |
| 3 | VCC | supply voltage, VCC=5V \pm 10% | | | | |
| 4 | R | receive data output; reads out data from the bus lines | | | | |
| 5 | Vref | common-mode stabilization output | | | | |
| 6 | CANL | LOW-level CAN bus line | | | | |
| 7 | CANH | HIGH-level CAN bus line | | | | |
| 8 | Rs | High speed and standby mode selection, low for high speed | | | | |

DESCRIPTION

Brief description

The HX65HVD251-S is an interface chip that connects the CAN protocol controller with the physical bus. It can be used in trucks, buses, cars, industrial control, and other applications. With a data transmission rate of 1Mbps, the HX65HVD251-S has the capability to transmit differential signals between the bus and the CAN protocol controller, fully compliant with the ISO 11898 standard.

Short circuit protection

The HX65HVD251-S's driver stage incorporates a current limit protection feature, designed to safeguard the circuit from shorts to the positive and negative supply voltages. In the event of a short-circuit, power consumption would rise, but thanks to the short-circuit protection function, the driver stage is protected from potential damage.

Fail Safe

The D pin features a pull-up to VCC connection, ensuring that the bus remains in a recessive state when the D pin is not powered. The Rs pin has a pull-up to VCC pass-through, ensuring that the transceiver remains in the standby state when the Rs pin is not powered. In the event of a power supply drop, the D, Rs, and R pins will become unconnected to prevent reverse power flow through these pins.

Over Temperature Protection

The HX65HVD251-S features an over-temperature protection function. When the junction temperature exceeds 160°C, the current of the driver stage is reduced. As the driver tube is the main energy-consuming component, reducing the current lowers power consumption, ultimately cooling the chip. Other parts of the chip continue to operate normally during this process.

Significant Timeout Function

The D dominant timeout timer circuit is built-in to prevent the bus line from being driven to a permanently dominant state (blocking all network communications) if the D pin is forced permanently low due to a hardware or software application failure. The timer is triggered by a negative edge on the D pin.

If the low level on the D pin persists longer than the internal timer value (tdom), the transmitter is disabled, driving the bus into a recessive state. The timer is reset by a positive edge on the D pin.

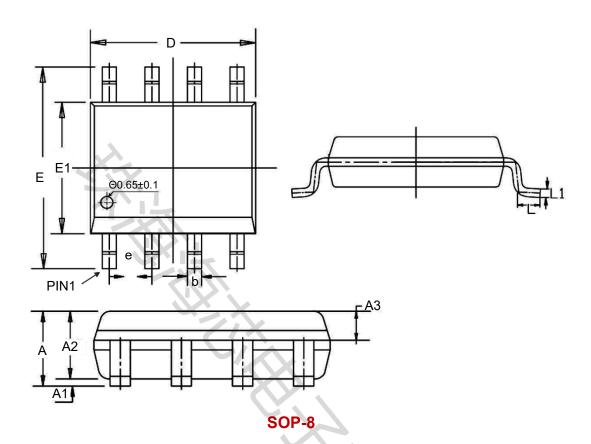

Control Modes

The control pin Rs allows selection between two operation modes: high-speed mode and standby mode. In high-speed mode—the normal mode—the transceiver sends and receives data over the CANH and CANL buses by grounding the Rs pin. In this mode, the differential receiver converts analogue data on the bus to digital data and outputs it via a multiplexer (MUX) to the R pin.

If the Rs pin is left unconnected or connected to a high voltage level, it enters standby mode. In this mode, the transmitter and receiver are turned off, and the bus line is monitored by a low-power differential comparator. When a high voltage level is applied to the Rs pin, it activates the low-power receiver and wake-up filter. As soon as the low-power differential comparator detects a dominant bus level above tBUS, the R pin goes low.
