

Features

- Wide Power Supply: +3.0V to +5.5V Single Supply
 - ◆ Robust ESD Protection:
- Robust 8kV – HBM and 2kV – CDM ESD Rating
- Green Product, MSOP8/SOP8 Package

Video Filter:

- HDTV Video Filter Support Composite 1080p/60
- Optimized 6th-order Butterworth Video reconstruction filter:
 - ◆ HD Channel: -3dB BW 72MHz
- Support Multiple Input Biasing:
 - ◆ Transparent Clamping for DC restoration
 - ◆ Provide 80-mV Level-Shift when DC-Coupled
- Very Low Quiescent Current: 11.5 mA(at 3.3V, Typical)
- 6dB Gain(2V/V), Rail to Rail Output
- AC- or DC-Coupled Output Driving Dual Video Loads (75Ω)

Comparator:

- Fast Response Time: 68 ns Propagation Delay
- Offset Voltage: ± 3.0 mV Maximum
- Internal Hysteresis Ensures Clean Switching
- Push-Pull, CMOS/TTL Compatible Output
- Same DC clamping circuit as video input.

Applications

- Video Signal Amplification
- Set-Top Box Video Driver
- PV、DVD Player Video Buffer
- Video Buffer for Portable or USB-Powered Video Devices
- HDTV

Pin Configuration (Top View)

Description

The TPF1441C is a low power, 72M HD composite video filter and comparator on a single chip. Drawing less than 11.5mA supply current over the full operating temperature range, TP1441C operates from a single 3.0V to 5.5V power supply.

TPF1441C integrates high-performance low-cost 72MHz composite video reconstruction filter, however it has very low power consumption. The filter is sixth-order Butterworth characteristics that are useful as digital-to-analog converter (DAC) reconstruction filters or as analog-to-digital converter (ADC) anti-aliasing filters. The HD filters can actually support 720p/1080p CVI/TVI/AHD platform. Moreover the filter can be bypassed to support wider bandwidth video application.

The TPF1441C's on-board comparator incorporates 3PEAK's proprietary and patented design techniques to achieve the ultimate combination of high-speed (68ns propagation delay under 3.0~5.5V wide supply range) and low power consumption, The internal input hysteresis eliminates output switching due to internal input noise voltage, reducing current draw. The PUSH-PULL output supports rail-to-rail output swing, and interfaces with CMOS/TTL logic.

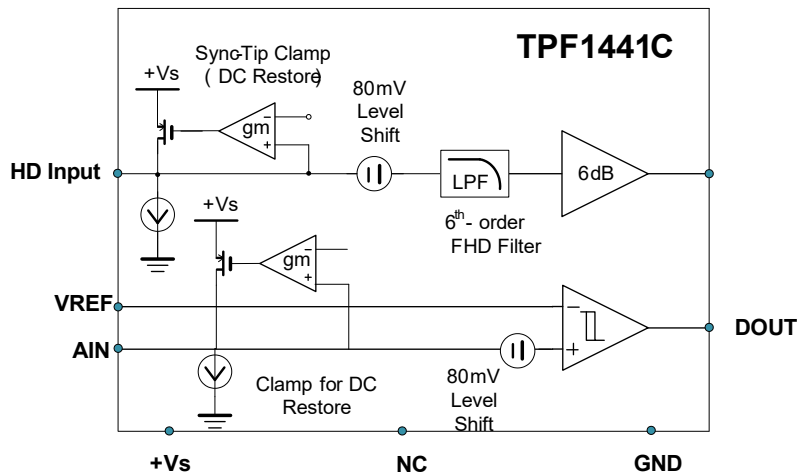

TPF1441C is available in SOP-8 package (TPF1441C-SR) and MSOP-8 package (TP1441C-VR). Its operation temperature range is from -40°C to +85°C.

Application Information

The TPF1441C is targeted for systems that require 1 channel high-definition (HD) video outputs. Although it can be used for numerous other applications, the needs and requirements of the video signal are the most important design parameters of the TPF1441C. The TPF1441C incorporates many features not typically found in integrated video parts while consuming very low power.

Internal Sync Clamp

The typical embedded video DAC operates from a ground referenced single supply. This becomes an issue because the lower level of the sync pulse output may be at a 0V reference level to some positive level. The problem is presenting a 0V input to most single supply driven amplifiers will saturate the output stage of the amplifier resulting in a clipped sync tip and degrading the video image. A larger positive reference may offset the input above its positive range.

The TPF1441C features an internal sync clamp and offset function to level shift the entire video signal to the best level before it reaches the input of the amplifier stage. These features are also helpful to avoid saturation of the output stage of the amplifier by setting the signal closer to the best voltage range.

The simplified block diagram of the TPF1441C is on Page-2. The AC coupled video sync signal is pulled negative by a current source at the input of the comparator amplifier. When the sync tip goes below the comparator threshold the output comparator is driven negative, The PMOS device turns on clamping sync tip to near ground level. The network triggers on the sync tip of video signal.

Comparator Internal Clamp

TPF1441C integrates a comparator, which supports UTC function monolithically. Because of the distortion of the control signal transmitted over a long cable, the rising/falling edges would become slower and the amplitude would be attenuated. Furthermore the DC component may be shifted due to inconsistent DC ground level between sending and receiving devices. In a traditional design, the reference of the comparator needs to be manually changed accordingly. In order to solve this application problem, TPF1441C implements a new feature on the input of comparator which clamps the bottom level of the input signal to 40.0 mV. Therefore, there is no need to consider the DC shift issue when choosing reference level, making the choice of reference level easier. Note that, to use this feature, the input must be AC-coupled and the capacitor selection is based on the control signal bandwidth. Typically a 0.1uF capacitor is used..

Droop Voltage and DC Restoration

Selection of the input AC-coupling capacitance is based on the system requirements. A typical sync tip width of a 64μs NTSC

line is 4μs during which clamp circuit restores its DC level. In the remaining 60μs period, the voltage droops because of a small constant 2.0μA sinking current. If the AC-coupling capacitance is 0.1μF, the maximum droop voltage is about 1mV which is restored by the clamp circuit. The maximum pull-up current of the clamp circuit is 1.7mA. For a 4μs sync tip width and 0.1μF capacitor, the maximum restoration voltage is about 80mV.

The line droop voltage will increase if a smaller AC-coupling capacitance is used. For the same reason, if larger capacitance is used the line droop voltage will decrease. Table 1 is droop voltage and maximum restoration voltage of the clamp for typical capacitance.

CAP VALUE (nF)	DROOP IN 60μs (mV)	CHARGE IN 4μs (mV)
100	1.2	68
1,000	0.12	6.8

Table 1. Maximum restoration voltage and droop voltage of Y signals for different capacitance

Low Pass Filter--Sallen Key

The Sallen Key is a classic low pass configuration. This provides a very stable low pass function, and in the case of the TPF1441C, the six-pole roll-off at around 72MHz. The six-pole function is accomplished with an RC low pass network placed in series with and before the Sallen Key.

Output Couple

TPF1441C output could support both “AC Couple” and “DC Couple”, if use “AC Couple”, this capacitor is typically between 220-μF and 1000-μF, although 470-μF is common. This value of this capacitor must be this large to minimize the line tilt (droop) and/or field tilt associated with ac-coupling as described previously in this document.

The TPF1441C internal sync clamp makes it possible to DC couple the output to a video load, eliminating the need for any AC coupling capacitors, thereby saving board space and additional expense for capacitors. This makes the TPF1441C extremely attractive for portable video applications. Additionally, this solution completely eliminates the issue of field tilt in the lower frequency. The trade-off is the supply current could be bigger. Typical load current for AC coupled is around 1mA, compared to typical 11.5mA used when DC coupling.

Output Drive Capability and Power Dissipation

With the high output drive capability of the TPF1441C, it is possible to exceed the +125°C absolute maximum junction temperature under certain load current conditions. Therefore, it is important to calculate the maximum junction temperature for an application to determine if load conditions or package types need to be modified to assure operation of the amplifier in a safe operating area. The maximum power dissipation allowed in a package is determined according to Equation:

$$PD_{MAX} = \frac{T_{JMAX} - T_{AMAX}}{\theta_{JA}}$$

Where:

TJMAX = Maximum junction temperature

TAMAX = Maximum ambient temperature

ΘJA = Thermal resistance of the package

The maximum power dissipation actually produced by an IC is the total quiescent supply current times the total power supply voltage, plus the power in the IC due to the load, or: for sourcing:

$$PD_{MAX} = V_s \times I_{SMAX} + (V_s - V_{OUT}) \times \frac{V_{OUT}}{R_L}$$

Where:

VS = Supply voltage

ISMAX = Maximum quiescent supply current

VOUT = Maximum output voltage of the application

RLOAD = Load resistance tied to ground

By setting the two PDMAX equations equal to each other, we can solve the output current and RLOAD to avoid the device overheat.

Power Supply Bypassing Printed Circuit Board Layout

As with any modern operational amplifier, a good printed circuit board layout is necessary for optimum performance. Lead lengths should be as short as possible. The power supply pin must be well bypassed to reduce the risk of oscillation. For normal single supply operation, a single 4.7µF tantalum capacitor in parallel with a 0.1µF ceramic capacitor from VS+ to GND will suffice.

Video Filter Driver Selection Guide

P/N	Product Description	Channel	-3dB Bandwidth	Package
TPF110 /TPF110L	Low power, enable function and SAG correction, 1 channel 6 th order 9MHz	1-SD	9MHz	SC70-5, SOT23-6
TPF113	Low power 3 channel, 6th-order 9MHz SD video filter	3-SD	9MHz	SO-8
