## 5V<sub>IN</sub>, 5A, Bi-directional Regulator for Single Cell Li-Ion Battery Power Bank Application

### General Description

SY6926 is a 4.1-6.5V<sub>IN</sub> up to 18V<sub>IN</sub> surge bi-directional regulator designed for single cell Li-Ion battery power bank application. Advanced bi-directional energy flow control with automatic input power source detection is adopted to achieve battery charging mode and battery power supply mode alternately. If the external power supply is present, SY6926 runs in battery charging mode with fully protection function; if the external power supply is absent, SY6926 runs in battery power supply mode with output current capability up to 2.5A.

SY6926 has an integrated reverse blocking switch to prevent current leaking from the system side or battery side to the input side and an integrated linear switch to achieve over voltage/current protection at the system side. A half bridge with 1MHz switching frequency is integrated to achieve power conversion for battery charging mode and battery power supply mode. All of them adopt N-channel MOSFETs with 18V rating and extremely low R<sub>DS(ON)</sub> to optimize operation efficiency and extend battery life-time.

SY6926 is available in QFN4x4 package to minimize the PCB layout size for wide portable applications.

### Ordering Information

SY6926 □(□□)□  
 □ Temperature Code  
 □ Package Code  
 □ Optional Spec Code

Ordering Number	Package type	Note
SY6926QYC	QFN4x4-20FC	

### Features

- Low Profile Package QFN4x4 for Portable Applications
- Integrated N-Channel MOSFETs with 18V Voltage Rating and Extremely Low R<sub>DS(ON)</sub>
- 1MHz Switching Frequency to Minimize Peripheral Circuit Design
- Trickle Current / Constant Current / Constant Voltage Charging Mode
- Maximum 5A Battery Charging Current
- Maximum 2.5A Sys current in Battery power supplement mode
- Automatic Input Power Source Detection
- Programmable SYS Voltage for Battery Power Supply Mode
- Programmable Constant Current Charging
- Programmable Over Current Limit for SYS load in Battery power supplement mode
- Programmable Battery Charging Timeout
- Programmable Input Current DPM
- Programmable Input Voltage DPM
- Charging shutdown control
- Charging mode CV tolerance +/-0.5%
- Charging mode CV voltage selectable between 4.2V&4.35V
- Host Enable Control for Standby Mode
- Over Temperature Protection
- Charge Status Indication

### Applications

- Single cell Li-Ion Power Bank
- Battery power path management

Typical Applications

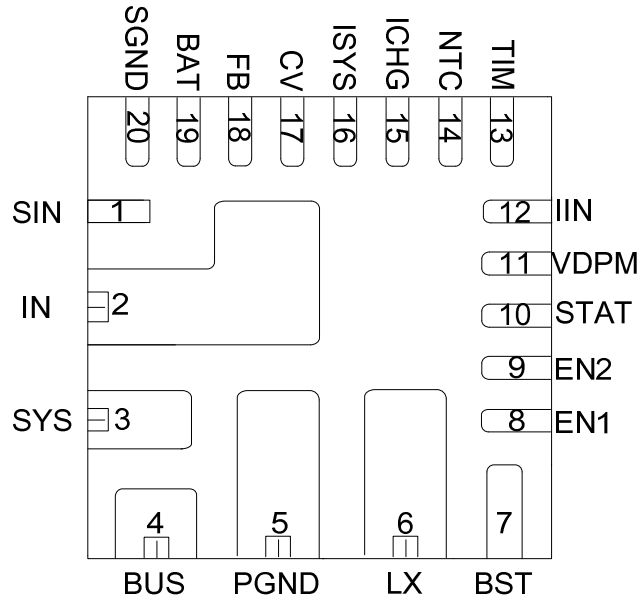

Figure 1. Schematic Diagram

Pinout (Top view)

(QFN4x4-20FC)

Top Mark: AXV.xyz (device code: AXV, x=year code, y=week code, z=lot number code)

Name	PIN Number	Description
SIN	1	Signal Input supply pin.
IN	2	Positive power supply input pin. $V_{IN}$ ranges from 4.1V to 6.5V for normal operation and up to 18V surge. Connect a MLCC from this pin to ground to decouple high frequency noise.
SYS	3	System load pin. Connect a MLCC from this pin to ground to decouple the high frequency noise.
BUS	4	Connection point for reverse blocking FET and bypass linear switch. Connect a MLCC from this pin to ground to decouple the high frequency noise .
PGND	5	Power ground pin.
LX	6	Switch node pin. Connect an external inductor from this pin to BAT pin.
BST	7	Boot strap pin. Connect a MLCC from this pin to LX.
EN1	8	Enable control pin for linear FET. Pull down EN1 to shutdown linear FET.
EN2	9	Enable control pin for linear FET and sync-boost converter both. If the external power source is present, the function of EN2 is disabled all. If the external power source is absent, pull down EN2 to shutdown linear FET and sync-boost converter both to save the leakage power from battery.
STAT	10	Charging status indication pin. It is open drain output pin and can be used to turn on a LED to indicate the charge in process. When the charge is done, LED is off.
VDPM	11	Input DPM voltage program pin. The regulated input voltage equals to $1.19 \cdot (1 + R_{DPM1}/R_{DPM2})$
IIN	12	Input current limit program pin. Constant input current reference is programmed by a resistor connected from this pin to ground.
TIM	13	Charging time limit pin. Connect this pin with a capacitor to ground. Internal current source charge the capacitor to set the charging time limit both for the Trickle Current mode, CV mode and Constant Current mode. Trickle current charging time limit is about 1/9 of Constant current and CV charging time.
NTC	14	Thermal protection pin. UTP threshold is about $61.6\%V_{BUS}$ and OTP threshold is about $30\%V_{BUS}$ . Pulling it down lower than 0.3V to disable charger.
ICHG	15	Battery charging current program pin. Constant current charging reference is programmed by a resistor connected from this pin to ground. The trickle charging current would be 1/10 of the constant charging current.
ISYS	16	System over current limit program pin. Connect a resistor from ISYS pin to ground to program the over current limit for system load. It has the max internal default limit.
CV	17	Charge voltage selection pin. Open or pull low for 4.2V. Pull high for 4.35V
FB	18	SYS voltage feedback pin. Program the external resistor divider to program the bus voltage. $V_{sys} = 1.19 \cdot (1 + R_{FB1}/R_{FB2})$ . The maximum sys Voltage set is 6V.
BAT	19	Battery positive pin. Also connect to inductor terminal.
SGND	20	Signal ground pin.

**Note 1:** Stresses beyond the “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only. Functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**Note 2:**  $\theta_{JA}$  is measured in the natural convection at  $T_A = 25^\circ\text{C}$  on a low effective four-layer thermal conductivity test board of JEDEC 51-3 thermal measurement standard.

**Note 3:** The device is not guaranteed to function outside its operating conditions

## General Function Description

### Automatic Input Power Supply Detection

Automatic input power supply detection in SY6926 adopts an internal current source with 10mA maximum capability to discharge the SIN pins for 100ms once  $V_{SIN}$  exceeds input UVLO threshold. If the external power supply is present normally,  $V_{SIN}$  should keep being higher than the input voltage UVLO even after 100ms discharging.

### Programmable Input Current Dynamic Power Management

The input current limit is programmable by  $R_{in}$ . Once input current reaches  $I_{in\_lim}$ , the input current will be limited in  $I_{in\_lim}$  by regulating the duty of Buck convertor.

### Programmable Input Voltage Dynamic Power Management

The input voltage limit is programmable by  $R_{DM1}, R_{DM2}$ . Once input voltage drops to  $V_{IN\_lim}$ , the input voltage will be limited in  $V_{IN\_lim}$  by regulating the duty of Buck convertor.

### SYS Over Current Limit

In boost mode, once SYS current exceeds the set SYS current limit the SYS current is limited in the set SYS current limit by regulating the duty of Boost converter .

### Charging mode Enable control

Once NTC is lower than 0.3V, Charging is disabled and is not recognized as a fault.

### Charging Status Indication Description

1. **Charging-In-Process** – Pull and keep STAT pin to Low;
2. **Charging Done** – Pull and keep STAT pin to High;
3. **Fault Mode** – Output high and low voltage alternatively with 0.7Hz frequency, fault mode includes VIN OVP, BAT OVP, BAT SCP, BAT UTP/OTP, charging time out.

Connect a LED from IN to STAT pin, **LED ON** indicates **Charging-in-Process**, **LED OFF** indicates **Charging Done**, **LED Flash** indicates **Fault Mode**.

### Protection Description

During the half-bridge operating as synchronous boost mode, SY6926 has BUS over voltage protection, SYS short circuit protection, BAT over discharging protection, and thermal protection for the Li-Ion battery and the device itself both.

**Thermal Protection**-Thermal protection for battery is achieved through NTC pin in charging and discharging mode. The basic scheme is shown in application information. Thermal shutdown is active for the device itself. IC recovers to normal work when the temperature returns into normal range again. Charging timer stops and maintains the result without reset.

**Short Circuit Protection**- There are BAT short circuit protection and SYS short circuit protection in SY6926. When  $V_{SYS}$  is lower than  $V_{SHORTSYS}$ , the linear FET modulates the current to be saw tooth shape from 0A to 1.7A for short circuit protection recovery. SY6926 tries recovery for 5ms per 0.7s. In charging mode once  $V_{BAT}$  is lower than  $V_{SHORTBT}$ , the switching frequency is fold back to 12.5% of the default value.

**Over Voltage Protection**- When  $V_{BUS}$  or  $V_{BAT}$  is higher than the over voltage protection threshold, the half bridge stops boost operation or buck operation immediately. It recovers to normal work when the monitored voltage backs to normal level. Input voltage has UVLO and OVP, which would make the device shutdown and recover to normal work when the  $V_{SIN}$  backs to normal range.

### Battery Over discharge protection

IN battery supplement mode, once battery voltage is lower than  $V_{BATDIS}$ , SY6926 will latch off. Only repower IC, or Bus higher than Bat can reset the latch off logic.

**Timeout Protection**- Programmable timeout protection for the Trickle Current Charge Mode and the Constant Current and CV Charge Mode both. Once timeout is active, the device stops the charge operation and latch-off. Only re-plug in power source can reset the latch logic and restart the normal charging work.

## Applications Information

Because of the high integration of SY6926, the application circuit based on this regulator IC is rather simple. Only input capacitor  $C_{IN}$ , bus capacitor  $C_{BUS}$ , battery capacitor  $C_{BAT}$ , inductor L, NTC resistors R1, R2, charging current program resistor  $R_{ICHG}$ , System over current limit program resistor  $R_{ISYS}$ , SYS voltage program resistor  $R_{FB1}$ ,  $R_{FB2}$ , VIN DPM program resistor  $R_{DM1}$ ,  $R_{DM2}$ , Input current limit program resistor  $R_{IN}$ , Battery over discharging voltage program resistor  $R_{DIS1}$ ,  $R_{DIS2}$ , and timer capacitor  $C_{TIM}$  need to be selected for the targeted applications specifications.

### NTC resistor:

SY6926 monitors battery temperature by measuring the BUS voltage and NTC voltage. The controller triggers the UTP or OTP when the rate K ( $K = V_{NTC}/V_{BUS}$ ) reaches the threshold of UTP ( $K_{UT}$ ) or OTP ( $K_{OT}$ ). The temperature sensing network is showed as below.

Choose R1 and R2 to program the proper UTP and OTP points.

The calculation steps of figure a are:

1. Define  $K_{UT}$ ,  $K_{UT} = 60.1 \sim 63.1\%$
2. Define  $K_{OT}$ ,  $K_{OT} = 28 \sim 32\%$
3. Assume the resistance of the battery NTC thermistor is  $R_{UT}$  at UTP threshold and  $R_{OT}$  at OTP threshold.
4. Calculate R2

$$R2 = \frac{K_{OT}(1 - K_{UT})R_{UT} - K_{UT}(1 - K_{OT})R_{OT}}{K_{UT} - K_{OT}}$$

5. Calculate R1

$$R1 = (1/K_{OT} - 1)(R2 + R_{OT})$$

If choose the typical values  $K_{UT} = 61.6\%$  and  $K_{OT} = 30\%$ , then

$$R2 = 0.365R_{UT} - 1.365R_{OT}$$

$$R1 = 2.3(R2 + R_{OT})$$

### Charging current program resistor $R_{ICHG}$

The charging current program resistor  $R_{ICHG}$  is calculated as below:

$$R_{ICHG} = (1 / I_{CC}) \times 16, \quad \text{Unit: Kohm}$$

While the  $I_{CC}$  is the constant charge current, unit is ampere.

### System over current limit program resistor $R_{ISYS}$

The system over current limit program resistor  $R_{ISYS}$  is calculated as below:

$$R_{ISYS} = 72 / I_{sys}, \quad \text{Unit: Kohm}$$

While the  $I_{sys}$  is the limited SYSTEM load current, Unit is ampere.

### SYS voltage program resistor $R_{FB1}$ , $R_{FB2}$

SYS voltage is programmed as below:

$$V_{SYS} = 1.19 \times (1 + \frac{R_{FB1}}{R_{FB2}}) \quad \text{Unit: V}$$

### Input current limit program resistor $R_{IN}$

Input current limit is programmed as below:

$$R_{in} = \frac{2}{I_{IN-lim}} \quad \text{Unit: Kohm}$$

While  $I_{in-lim}$ , Unit is ampere.

### VIN DPM program resistor $R_{DM1}$ , $R_{DM2}$

Input voltage limit is programmed as below:

$$V_{IN-lim} = 1.19 \times (1 + \frac{R_{DM1}}{R_{DM2}}) \quad \text{Unit: V}$$

### Timer capacitor $C_{TIM}$

The charger also provides a programmable charging timer. The charging time is programmed by the capacitor connected between the TIM pin and GND. The capacitance is given by the formula:

$$C_{TIM} = 2 * 10^{-11} T_{CC} \quad \text{Unit: F}$$

$T_{CC}$  is the target constant charging time, unit is second.

### Input capacitor $C_{IN}$ :

Input capacitor reduces the surge current drawn from the input and the switching noise from the device. The input capacitor impedance at the switching frequency should be less than the input source

impedance to prevent high-frequency-switching current from passing to the input.

To minimize the potential noise problem, place a typical X7R or better grade ceramic capacitor really close to the IN and GND pins. Care should be taken to minimize the loop area formed by C<sub>IN</sub>, and IN/GND pins. At least 20uF ceramic capacitor are suggested.

#### Bus capacitor C<sub>BUS</sub>:

##### 1. Buck mode

The capacitor acts as the input capacitor of the buck converter. The input current ripple rms value is larger than:

$$I_{CIN\_MIN} = I_{CHG} \sqrt{D(1-D)}$$

While I<sub>CHG</sub> is the charge current.

##### 2. Boost mode

C<sub>BUS</sub> is the output capacitor of boost converter. C<sub>BUS</sub> reduces the bus voltage ripple and ensures the stability of boost. The output current ripple rms value is :

$$I_{CBUS\_RMS} = \frac{\Delta I}{2\sqrt{3}}$$

While ΔI is the current ripple of inductor.

At least 20uF ceramic capacitor are suggested.

#### Battery capacitor C<sub>BAT</sub>:

##### 1. Buck mode

Battery capacitor acts as the output capacitor of Buck converter. C<sub>BAT</sub> is selected to handle the output ripple noise requirements. Both steady state ripple and transient requirements must be taken into consideration when selecting this capacitor. For the best performance, it is recommended to use X7R or better grade ceramic capacitor. The output voltage ripple is calculated as below:

$$V_{Ripple\_BAT\_Buck} = \frac{(1-D) \times V_{BAT}}{8C_{BAT} F_{SW}^2 L}$$

Where F<sub>SW</sub> is the switching frequency.

##### 2. Boost mode

C<sub>BAT</sub> acts as the input capacitor of Boost converter. The input voltage ripple is calculated as below:

$$V_{Ripple\_BAT\_Boost} = \frac{D \times V_{BAT}}{8C_{BAT} F_{SW}^2 L}$$

Where F<sub>SW</sub> is the switching frequency.

At least 20uF ceramic capacitor are suggested.

#### Inductor L:

Inductor selection trades off between cost, size, and efficiency. A lower inductance value corresponds with smaller size, but results in higher ripple currents, higher magnetic hysteretic losses, and higher output capacitances. However, a higher inductance value benefits from lower ripple current and smaller output filter capacitors, but results in higher inductor DC resistance (DCR) loss. An inductor must not saturate under the worst-case condition.

##### 1. Buck mode

1) Choose the inductance to provide the desired ripple current. It is suggested to choose the ripple current to be about 40% of the average input current. The inductance is calculated as:

$$L = \frac{V_{BAT}(1 - V_{BAT}/V_{IN\_MAX})}{F_{SW} \times I_{CHG\_MAX} \times 40\%}$$

Where F<sub>SW</sub> is the switching frequency and I<sub>CHG,MAX</sub> is the maximum charge current.

SY6926 is quite tolerant of different ripple current amplitude. Consequently, the final choice of inductance can be slightly off the calculation value without significantly impacting the performance.

2) The saturation current rating of the inductor must be selected to be greater than the peak inductor current under full load conditions.

$$I_{SAT\_MIN} > I_{CHG\_MAX} + \frac{V_{BAT}(1 - V_{BAT}/V_{IN\_MAX})}{2 \times F_{SW} \times L}$$

3) The DCR of the inductor and the core loss at the switching frequency must be low enough to achieve the desired efficiency requirement.

##### 2. Boost mode

1) Choose the inductance to provide the desired ripple current. It is suggested to choose the ripple current to be about 40% of the average input current. The inductance is calculated as:

$$L = \frac{V_{BAT}(1 - V_{BAT}/V_{BUS\_MAX})}{F_{SW} \times I_{DIS\_MAX} \times 40\%}$$

Where F<sub>SW</sub> is the switching frequency and I<sub>DIS,MAX</sub> is the maximum discharge current.

SY6926 is quite tolerant of different ripple current amplitude. Consequently, the final choice of inductance can be slightly off the calculation value without significantly impacting the performance.

2) The saturation current rating of the inductor must be selected to be greater than the peak inductor current under full load conditions.

$$I_{SAT, MIN} > I_{DIS, MAX} + \frac{V_{BAT}(1 - V_{BAT}/V_{BUS\_MAX})}{2 \times F_{SW} \times L}$$

- 3) The DCR of the inductor and the core loss at the switching frequency must be low enough to achieve the desired efficiency requirement.

I <sub>cc</sub> (A)	L(uH)
2	1
5	0.68

### Layout Design:

The layout design of SY6926 regulator is relatively simple. For the best efficiency and minimum noise problems, we should place the following components close to the IC: C<sub>IN</sub>, C<sub>BUS</sub>, L.

1) It is desirable to maximize the PCB copper area connecting to GND pin to achieve the best thermal and noise performance. If the board space allowed, a ground plane is highly desirable.

2) C<sub>IN</sub> must be close to Pins IN and GND, C<sub>BUS</sub> must get close to Pins BUS and GND. The loop area formed by C<sub>IN</sub> and GND, C<sub>BUS</sub> and GND must be minimized.

Following figure is the recommended layout design.

3) The PCB copper area associated with LX pin must be minimized to avoid the potential noise problem.

4) The capacitor C<sub>TIM</sub> and the trace connecting to the TIM pin must not be adjacent to the LX net on the PCB layout to avoid the noise problem. It should be better to ground C<sub>TIM</sub> to the output capacitor's ground.

5) In high current applications, a RC snubber circuit should be placed between LX and GND for better EMI.
