LM49450 Boomer ™ I²S Input, 2.5W/Channel, Low EMI, Stereo, Class D Audio Sub-System with Ground Referenced Headphone Amplifier, 3D Enhancement, and Headphone Sense

Check for Samples: LM49450

FEATURES

- 24–Bit Stereo DAC
- Stereo Filterless Class D Operation
- Selectable Spread Spectrum Mode Reduces EMI
- Ground Referenced Headphone Amplifiers with 100dB SNR
- I²S Compatible Audio Interface
- Audio Sample Rates up to 192kHz
- TI's 3D Enhancement
- 32-Step Digital Volume Control
- I²C-Compatible Control Interface
- Headphone Sense Input
- Stereo Analog Line Inputs
- Output Short Circuit Protection
- Thermal Overload Protection
- Minimum External Components
- Click and Pop Suppression
- Micro-Power Shutdown
- Available in Space-Saving 32-Pin WQFN Package

APPLICATIONS

- Portable Media Players
- Portable Navigation Devices
- Multi-Media Monitors
- Laptops
- Portable Gaming Devices
- Mobile Handsets

KEY SPECIFICATIONS

- SNR at Headphone Output: 102dBA (typ)
- Speaker Amplifier Efficiency at 3.6V, 650mW/Channel into 8Ω: 87% (typ)
- Speaker Amplifier Efficiency at 5V, 1.1W/Channel into 8Ω: 80% (typ)
- Quiescent Power Supply Current Line Inputs:
  - Speaker Mode at LSVDD = 3.6V: 7.5mA (typ)
  - Headphone Mode at HPVDD = 2.5V: 5.3mA (typ)
- Output Power/Channel Speaker at LSV_{DD} = 5V:
  - R_L = 4Ω, THD+N ≤ 10%: 2.5W (typ)
  - R_L = 8Ω, THD+N ≤ 1%: 1.25W (typ)
- Headphone at HPV_{DD} = 2.5V:
  - R_L = 16Ω, THD+N ≤ 1%: 34mW (typ)
  - R_L = 32Ω, THD+N ≤ 1%: 36mW (typ)
- PSRR at 1kHz
  - Speaker Mode: 67dB (typ)
  - Headphone Mode: 77dB (typ)
- Shutdown current: 0.02µA (typ)

DESCRIPTION

The LM49450 is a fully integrated audio subsystem designed for portable media player applications. The LM49450 combines a 24-bit I²S digital-to-analog converter (DAC), 2.5W/channel stereo Class D speaker drivers, 36mW stereo ground referenced headphone drivers, volume control, and TI's unique 3D sound enhancement into a single device.

DESCRIPTION (CONTINUED)

The filterless Class D amplifiers deliver 1.25W/channel into an 8Ω load with <1% THD+N with a 5V supply. The LM49450 offers two logic selectable modulation schemes, fixed frequency mode, and an EMI reducing spread spectrum mode. The 36mW/channel headphone drivers feature TI's ground referenced architecture that creates a ground-referenced output from a single supply, eliminating the need for bulky and expensive DC-blocking capacitors, saving space and minimizing system cost. A headphone sense input (HPS) automatically detects the presence of a headphone, and configures the device accordingly.

The LM49450 stereo, 24-bit DAC supports a wide range of sample rates (including 192kHz, 96kHz, 48kHz, and 44.1kHz). The digital audio signal path features better than 100dB SNR, and low 0.05% THD+N when measured at the headphone outputs. The flexible 3-wire I^2S interface supports left or right justified audio data.

The LM49450 features separate 32-step volume control for the headphones and speaker outputs. 3D enhancement, mode selection, shutdown control, and volume are controlled through an I^2C compatible interface.

Output short circuit and thermal overload protection prevent the device from being damaged during fault conditions. Superior click and pop suppression eliminates audible transients on power-up/down and during shutdown. The LM49450 is available in a space saving 32-pin WQFN package.

Typical Application

5mm x 5mm x 0.8mm
Package Number RTV0032A

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

Absolute Maximum Ratings(1)(2)(3)

Supply Voltage(1)	6.0V
Storage Temperature	−65°C to +150°C
Input Voltage	–0.3V to V_{DD} +0.3V
Power Dissipation(4)	Internally Limited
ESD Susceptibility(5)	2000V
ESD Susceptibility(6)	200V
Junction Temperature (T_{JMAX})	150°C
Thermal Resistance	
θ_{JC}	2.4°C/W
θ_{JA}	28.4°C/W

(1) "*Absolute Maximum Ratings*" indicate limits beyond which damage to the device may occur, including inoperability and degradation of device reliability and/or performance. Functional operation of the device and/or non-degradation at the *Absolute Maximum Ratings* or other conditions beyond those indicated in the *Recommended Operating Conditions* is not implied. The *Recommended Operating Conditions* indicate conditions at which the device is functional and the device should not be operated beyond such conditions. All voltages are measured with respect to the ground pin, unless otherwise specified

(2) The *Electrical Characteristics* tables list ensured specifications under the listed *Recommended Operating Conditions* except as otherwise modified or specified by the *Electrical Characteristics Conditions* and/or Notes. Typical specifications are estimations only and are not ensured.

(3) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/ Distributors for availability and specifications.

(4) The maximum power dissipation must be derated at elevated temperatures and is dictated by T_{JMAX} , θ_{JA}, and the ambient temperature, T_A. The maximum allowable power dissipation is $P_{DMAX} = (T_{JMAX} – T_A) / \theta_{JA}$ or the number given in *Absolute Maximum Ratings*, whichever is lower.

(5) Human body model, applicable std. JESD22-A114C.

(6) Machine model, applicable std. JESD22-A115-A.

Operating Ratings(1)(2)

Temperature Range	
$T_{MIN} \le T_A \le T_{MAX}$	$-40°C \le T_A \le +85°C$
Supply Voltage (V_{DD}, LSV_{DD})	$2.7V \le V_{DD} \le 5.5V$
Headphone Supply Voltage (CPV_{DD}, HPV_{DD})	$1.8V \le V_{DD} \le 2.7V$
Digital Core Supply Voltage (DV_{DD})	$2.7V \le DV_{DD} \le 4.5V$
Digital IO Supply Voltage (IOV_{DD})	$1.8V \le IOV_{DD} \le 4.5V$

(1) "*Absolute Maximum Ratings*" indicate limits beyond which damage to the device may occur, including inoperability and degradation of device reliability and/or performance. Functional operation of the device and/or non-degradation at the *Absolute Maximum Ratings* or other conditions beyond those indicated in the *Recommended Operating Conditions* is not implied. The *Recommended Operating Conditions* indicate conditions at which the device is functional and the device should not be operated beyond such conditions. All voltages are measured with respect to the ground pin, unless otherwise specified

(2) The *Electrical Characteristics* tables list ensured specifications under the listed *Recommended Operating Conditions* except as otherwise modified or specified by the *Electrical Characteristics Conditions* and/or Notes. Typical specifications are estimations only and are not ensured.

Electrical Characteristics V_{DD} = LSV_{DD} = 3.6V, HPV_{DD} = CPV_{DD} = 2.5V[1][2]

The following specifications apply for Headphone: A_V = 0dB, $R_{L(LS)}$ = 8Ω, $R_{L(HP)}$ = 32Ω, f = 1kHz, C_1 = C_2 = 2.2µF, unless otherwise specified. Limits apply for T_A = 25°C.

Symbol	Parameter	Conditions	LM49450		Units (Limits)
			Typical[3]	Limit[4]

APPLICATION INFORMATION

I²C-COMPATIBLE INTERFACE

The LM49450 is controlled through an I²C-compatible serial interface that consists of a serial data line (SDA) and a serial clock (SCL). The clock line is uni-directional. The data line is bi-directional (open collector). The LM49450 and the master can communicate at clock rates up to 400kHz. Figure 65 shows the I²C interface timing diagram. Data on the SDA line must be stable during the HIGH period of SCL. The LM49450 is a transmit/receive slave-only device, reliant upon the master to generate the SCL signal. Each transmission sequence is framed by a START condition and a STOP condition (Figure 66). Each data word, register address and register data, transmitted over the bus is 8 bits long as is always followed by and acknowledge pulse (Figure 67). The LM49450 device address is 1111101.

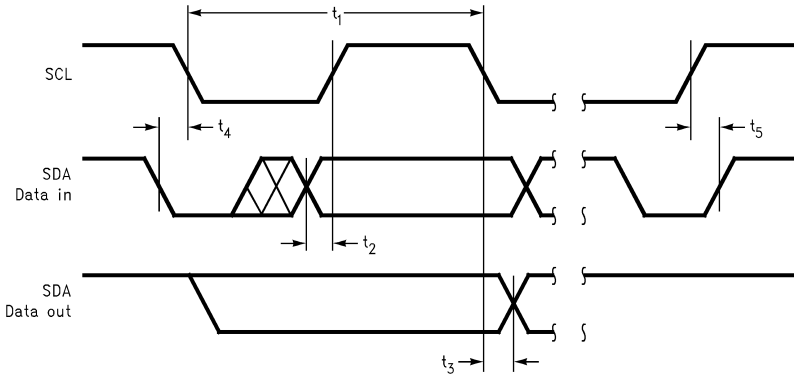

Figure 65. I²C Timing Diagram

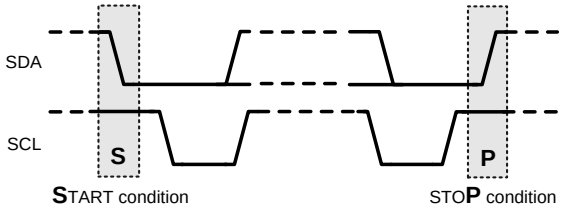

Figure 66. START and STOP Diagram

Figure 67. Example I²C Write Cycle

BUS FORMAT

The I²C bus format is shown in Figure 69. The START signal, the transition of SDA from HIGH to LOW while SDA is HIGH, is generated, altering all devices on the bus that a device address is being written to the bus.

The 7-bit device address is written to the bus, most significant bit (MSB) first, followed by the R/$\overline{W}$ bit (R/$\overline{W}$ = 0 indicates the master is writing to the LM49450, R/$\overline{W}$ = 1 indicates the master wants to read data from the LM49450). The data is latched in on the rising edge of the clock. Each address bit must be stable while SDA is HIGH. After the last address bit is transmitted, the master device releases SDA, during which time, an acknowledge clock pulse is generated by the slave device. If the LM49450 receives the correct address, the device pulls the SDA line low, generating and acknowledge bit (ACK).

Once the master device registers the ACK bit, the 8-bit register address word is sent. Each data bit should be stable while SCL is HIGH. After the 8-bit register address is sent, the LM49450 sends another ACK bit. Following the acknowledgement of the register address, the 8-bit register data word is sent. Each data bit should be stable while SCL is HIGH. After the 8-bit register data is sent, the LM49450 sends another ACK bit. Following the acknowledgement of the register data word, the master issues a STOP bit, allowing SDA to go high while SDA is high.

I²S DATA FORMAT

The LM49450 supports three I²S formats: Normal Mode (Figure 68), Left Justified Mode (Figure 69), and Right Justified Mode (Figure 70). In Normal Mode, the audio data is transmitted MSB first, with the unused bits following the LSB. In Left Justified Mode, the audio data format is similar to the Normal Mode, without the delay between the LSB and the change in I²S_WS. In Right Justified Mode, the audio data MSB is transmitted after a delay of a preset number of bits.

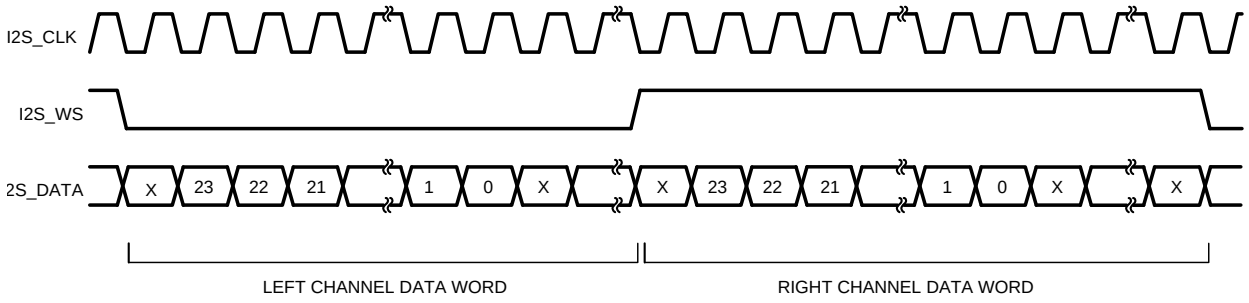

Figure 68. I²S Normal Input Format

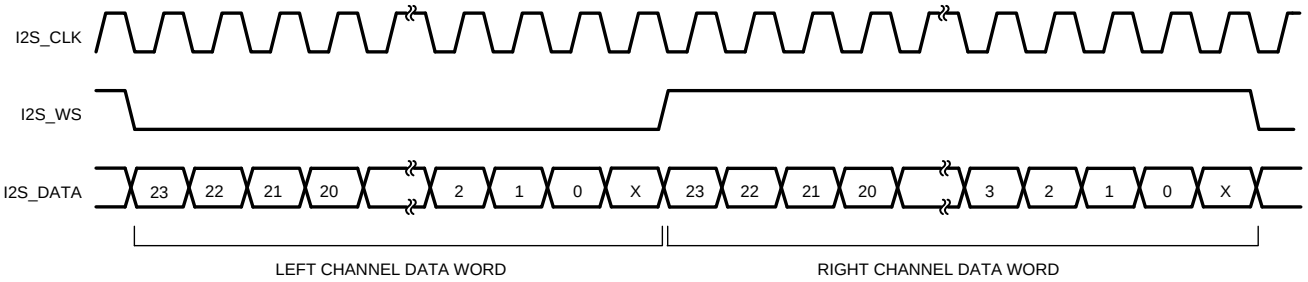

Figure 69. I²S Left-Justified Input Format

GENERAL AMPLIFIER FUNCTION

Class D Amplifier

The LM49450 features a high-efficiency stereo Class D audio power amplifier that utilizes TI's filterless modulation scheme which reduces external component count, conserves board space and reduces system cost. The Class D outputs transition between V_{DD} and GND with a 300kHz switching frequency. With no signal applied, the outputs switch with a 50% duty cycle, in phase, causing the two outputs to cancel. This cancellation results in no net voltage across the speaker, thus there is no current to the load in the idle state.

With the input signal applied, the duty cycle (pulse width) of the LM49450 outputs changes. For increasing output voltage, the duty cycle of V_LS+ increases while the duty cycle of V_LS- decreases. For decreasing output voltages, the converse occurs. The difference between the two pulse widths yield the differential output voltage.

Fixed Frequency Mode

The LM49450 features two modulation schemes, a fixed frequency mode and a spread spectrum mode. Select the fixed frequency mode by setting the SS bit (B3) in the Mode Control Register (0x00h) to 0. In fixed frequency mode, the speaker amplifier outputs switch at a constant 300kHz. The output spectrum in fixed frequency mode consists of the fundamental and its associated harmonics (see Typical Performance Characteristics).

Spread Spectrum

The logic selectable spread spectrum mode eliminates the need for output filters, ferrite beads or chokes. In spread spectrum mode, the switching frequency varies randomly by 30% about a 300kHz center frequency, reducing the wide-band spectral content, improving EMI emissions radiated by the speaker and associated cables and traces. Where a fixed frequency class D exhibits large amounts of spectral energy at multiples of the switching frequency, the spread spectrum architecture of the LM49450 spreads that energy over a larger bandwidth (see Typical Performance Characteristics). The cycle-to-cycle variation of the switching period does not affect the audio reproduction, efficiency, or PSRR. Set the SS bit (B3) in the Mode Control Register (0x00h) to 1 to select spread spectrum mode.

Headphone Amplifier

The LM49450 headphone amplifiers feature TI's ground referenced architecture that eliminates the large DC-blocking capacitors required at the outputs of traditional headphone amplifiers. A low-noise inverting charge pump creates a negative supply (HPV_{SS}) from the positive supply voltage (CPV_{DD}). The headphone amplifiers operate from these bipolar supplies, with the amplifier outputs biased about GND, instead of a nominal DC voltage (typically $V_{DD}/2$), like traditional amplifiers. Because there is no DC component to the headphone output signals, the large DC-blocking capacitors (typically 220µF) are not necessary, conserving board space and system cost, while improving frequency response.

Power Supplies

The LM49450 uses different power supplies for each portion of the device, allowing for the optimum combination of headroom, power dissipation and noise immunity. The analog input, and gain (volume control) stages for both speaker and headphones are powered from V_{DD}. The speaker output stage is powered from LSV_{DD}. The headphone amplifiers and charge pump are powered from HPV_{DD}. The separate power supplies allow the class D amplifiers to operate from a higher voltage, maximizing headroom, while the headphones operate from a lower voltage, improving power dissipation, as well as minimizing switching noise coupling between the speaker and headphone amplifiers. The digital portion of the device is powered from DV_{DD}, including the 3D processing core and DAC. IOV_{DD} powers the I^2S and I^2C, allowing the LM49450 to interface with lower voltage digital controllers.

TI's 3D Enhancement

The LM49450 digital audio path features TI's 3D enhancement that widens or narrows the perceived soundstage of a stereo audio signal. The 3D enhancement either increases or decreases the apparent stereo channel separation, improving audio reproduction whenever the placement of both left and right speakers is not ideal.

The LM49450 3D function is controlled through the I^2C interface. The headphone and speakers have independent 3D controls, allowing each signal path to have its own individual 3D configuration. The LM49450 3D features two effect modes, a narrow effect that decreases the channel separation, making the speakers sound closer together, and a wide effect that makes the speakers sound farther apart. Because the narrow effect mode adds a portion of the left and right signals together, a selectable 6dB attenuation mode is provided to maintain a constant output amplitude when the narrow effect mode is active without changing the volume level. The high pass 3dB roll off frequency, 3D gain (amount channel mixing), and narrow/wide effect selection is done through registers 0x05h (headphone) and 0x06h (speaker. See the Headphone 3D Configuration Register and Headphone 3D Configuration Register sections for more information.

Headphone Sense

The LM49450 features a headphone sense input (HPS) that monitors the headphone jack and configures the device depending on the presence of a headphone. When the HPS pin is low, indicating that a headphone is not present, the LM49450 speaker amplifiers are active and the headphone amplifiers are disabled. When the HPS pin is high, indicating that a headphone is present, the headphone amplifiers are active while the speaker amplifiers are disabled.

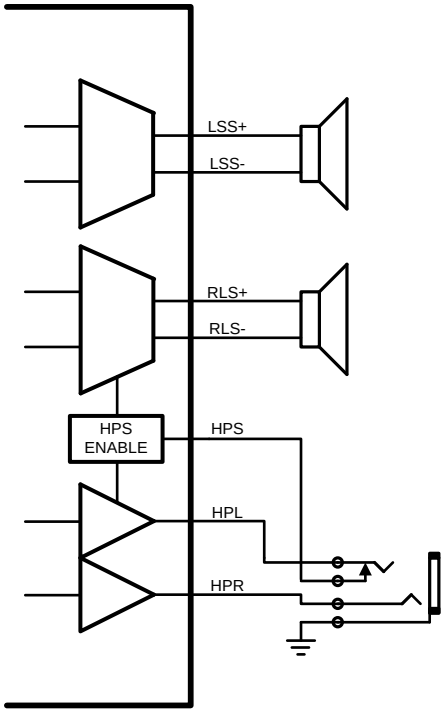

Figure 71. HPS Connection

Volume Control

The LM49450 features two separate 32-step volume controls, one for the speaker channels and one for the headphone channels. This allows for the gain of the headphone and speakers to be set independently of each other.

External Reference

The LM49450 can be used with an external reference. Disable the internal reference by setting bit B7 of the Mode Control Register (0x00h) to 1. This allows an external reference voltage to be applied to REF. For proper operation, do not allow the V_{REF} to exceed V_{DD}.

Low Power Shutdown

The LM49450 features an I²C selectable low power shutdown mode that disables the entire device, reducing quiescent current consumption to 0.05µA (digital + analog current). Set bit B0 in the mode control register (0x00h) to 0 to disable the device. Set B0 to 1 to enable the device.

I²S CLOCK CONTROL

The LM49450 features the ability to derive multiple clock signals, including the DAC clock, I²S clock and word select clock in master mode, and the charge pump oscillator frequency, from the MCLK input.

DAC Clock Divider (RDIV)

Bits B5-B0 in the CLOCK CONTROL register (0x01h) are the RDIV bits that set the DAC clock divider ratio. The DAC clock derived from MCLK needs to match the DAC sampling rate. For example, with f_{MCLK} = 12.288MHz and a 64*f_S oversampling ratio (f_S = 48kHz), the DAC requires a 6.144MHz clock. In this case, set the RDIV ratio to divide by 2. In other instances, there may not be a suitable divider ratio for a given sampling rate and MCLK frequency. In this case, f_{MCLK} may need to be altered. See the Clock Control Register section for more information.

I²S WS Clock Dividers (I²S_CLK, WS_CLK)

In I²S master mode, the LM49450 I²S CLOCK CONTROL register (0x04h) can be used to set the I²S clock and WS clock frequency. In I²S clock master mode, bits B7-B4 of the I²S CLOCK CONTROL register, the I²S_CLK bits, set the I²S clock divider ratio. The LM49450 derives the I²S clock from DAC clock based on the ratio set by the I²S_CLK bits. The I²S clock is output on I²S_CLK.

In I²S master mode, bits B3 and B2 (I²S_WS) of the I²S CLOCK CONTROL register set the bit length per data word of the I²S WS.

Charge Pump Clock Divider (CPDIV)

The ground referenced headphone amplifiers charge pump derives its clock from MCLK. Bits B7-B0 of the CHARGE PUMP CLOCK register (0x02h) set the charge pump clock divider ratio. See the Charge Pump Clock Register section for more information.

CLK NETWORK

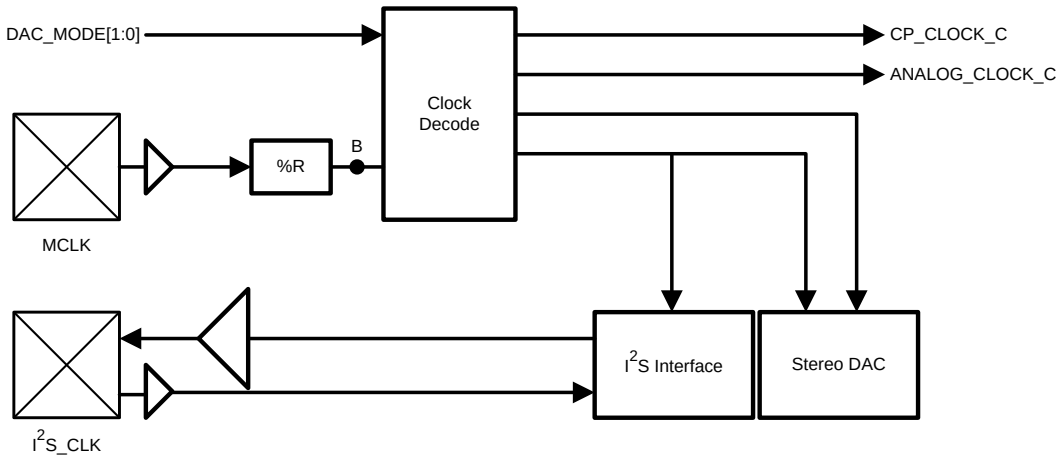

Figure 72. CLK Network Diagram

LM49450 Clock Structure

The MCLK input is first divided by the R divider to product the clock at point B; this is then decoded according to the DAC_MODE to produce a signal which goes to both the DAC digital and the I2S interface, and a signal which goes to the DAC analog.

This table describes the relationship between the clocks, for each of the four possible DAC modes in terms of audio input sampling frequency fs.

Table 4. Relationship between clocks for each of the four DAC modes

DAC MODE	Description			
	OSR	CLK at B	DAC Digital CLK	DAC Analog CLK
00	125	250fs	250fs	125fs
01	128	256fs	128fs	128fs
10	64	128fs	128fs	64fs
11	32	128fs	128fs	32fs

Common Clock Settings for the DAC

In DAC_MODE 0, the DAC has an oversampling rate (OSR) of 125 but requires a 250xfs clock at point B. This allows a simple clocking solution as it will work from 12.000MHz (common in most systems with Bluetooth or USB) at 48kHz exactly. In the other DAC modes, the DAC requires a conventional 2^Nxfs clock for conversation. The following table describes the clock required at point B for various clock sample rates in the different DAC modes:

Table 5. Common DAC Clock Frequencies

Sample Rate	Clock Required at B (MHz)			
	DAC MODE = 2b00 (OSR = 125fs, Clock Required = 250fs)	DAC MODE = 2b01 (OSR = 128fs, Clock Required = 256fs)	DAC MODE = 2b10 (OSR = 64fs, Clock Required = 128fs)	DAC MODE = 2b11 (OSR = 32fs, Clock Required = 128fs)
8	2	2.048	—	—

192	—	—	—	24.576

CHARGE PUMP CLOCK REGISTER (0x02h)

The charge pump clock register sets the charge pump frequency derived from MCLK when the LM49450 is in DAC mode. Default value is for register 02h is 0x49h.

Table 6. Charge Pump Clock Register

Bit	Name	Value								Description
B7:B0	CPDIV_7(B7) CPDIV_6 (B6) CPDIV_5 (B5) CPDIV_4 (B4) CPDIV_3 (B3) CPDIV_2 (B2) CPDIV_1 (B1) CPDIV_0 (B0)	B7	B6	B5	B4	B3	B2	B1	B0	Sets charge pump oscillator frequency in DAC mode (derived from MCLK).
		0	0	0	0	0	0	0	0	Bypass divider

CP_DIV REGISTER

LM49450 Clock Structure

This register is used to control the charge pump clock when the register field LINE_IN_ENABLE is low i.e. DAC mode. When the register field LINE_IN_ENABLE is high, the Clocks module is held in reset and as a result no CP_CLOCK_C is produced.

Table 7. CP_DIV Default Value 0x49h

Bits	Field	Description	
7:0	CP_DIV	Programs the CP divider (devides from an expected 12.000MHz input).	
		CP_DIV	Divide Value
		0	Bypass
		1	1
		2	1.5
		3	2
		4	2.5
		5 to 253	3 to 127
		254	127.5
		255	128

Examples of CP_DIV Values one might use for various sample rates and DAC modes

DAC COMPENSATION FILTER REGISTERS (0x09h to 0x0Eh)

DAC Compensation Filter

The LM49450 DAC features a 5 band FIR filter that can be used as an equalizer for the digital audio path. Registers 0x09h, 0x0Ah, 0x0Bh, 0x0Ch, 0x0Dh, and 0x0Eh provide an 8-bit control for each individual FIR filter.

EXTERNAL COMPONENT SELECTION

The LM49450 uses different supplies for each portion of the device, allowing for the optimum combination of headroom, power dissipation and noise immunity. The speaker amplifier gain stage is powered from V_{DD}, while the output stage is powered from LSV_{DD}. The headphone amplifiers, input amplifiers and volume control stages are powered from HPV_{DD}. The separate power supplies allow the speakers to operate from a higher voltage for maximum headroom, while the headphones operate from a lower voltage, improving power dissipation. HPV_{DD} may be driven by a linear regulator to further improve performance in noisy environments. The I^2C portion if powered from I^2CV_{DD}, allowing the I^2C portion of the LM49450 to interface with lower voltage digital controllers.

PROPER SELECTION OF EXTERNAL COMPONENTS

Power Supply Bypassing and Filtering

Proper power supply bypassing is critical for low noise performance and high PSRR. Place the supply bypass capacitors as close to the device as possible. Typical applications employ a voltage regulator with 10µF and 0.1µF bypass capacitors that increase supply stability. These capacitors do not eliminate the need for bypassing of the LM49450 supply pins. A 1µF ceramic capacitor placed close to each supply pin is recommended.

Bypass Capacitor Selection

The LM49450 internally generates a $V_{DD}/2$ common-mode bias voltage. The BYPASS capacitor CBYPASS, improves PSRR and THD+N by reducing noise at the BYPASS node. Use a 2.2µF ceramic placed as close to the device as possible.

REF Capacitor Selection

The LM49450 generates an internal low noise reference voltage used by the DAC. For best THD+N performance, bypass REF with 10µF and 0.1µF ceramic capacitors.

Charge Pump Capacitor Selection

Use low ESR ceramic capacitors (less than 100mΩ) for optimum performance.

Charge Pump Flying Capacitor (C1)

The flying capacitor (C1) affects the load regulation and output impedance of the charge pump. A C1 value that is too low results in a loss of current drive, leading to a loss of amplifier headroom. A higher valued C1 improves load regulation and lowers charge pump output impedance to an extent. Above 2.2µF, the $R_{DS(ON)}$ of the charge pump switches and the ESR of C1 and C2 dominate the output impedance. A lower value capacitor can be used in systems where low maximum output power requirements.

Charge Pump Hold Capacitor (C2)

The value and ESR of the hold capacitor (C2) directly affects the ripple on CPV_{SS}. Increasing the value of C2 reduces output ripple. Decreasing the ESR of C2 reduces both output ripple and charge pump output impedance. A lower value capacitor can be used in systems where low maximum output power requirements.

Input Capacitor Selection

The LM49450 analog inputs require input coupling capacitors. Input capacitors block the DC component of the audio signal, eliminating any conflict between the DC component of the audio source and the bias voltage of the LM49450. The input capacitors create a high-pass filter with the input resistors R_{IN}. The -3dB point of the high pass filter is found using Equation 1 below.

$f = 1 / 2\pi R_{IN} C_{IN}$

where

- the value of R_{IN} is typically 20kΩ (1)

The input capacitors can also be used to remove low frequency content from the audio signal. Small speakers cannot reproduce, and may even be damaged by low frequencies. High pass filtering the audio signal helps protect the speakers. When the LM49450 is using a single-ended source, power supply noise on the ground is seen as an input signal. Setting the high-pass filter point above the power supply noise frequencies, 217Hz in a GSM phone, for example, filters out the noise such that it is not amplified and heard on the output. Capacitors with a tolerance of 10% or better are recommended for impedance matching and improved CMRR and PSRR.

PCB Layout Guidelines

Minimize trace impedance of the power, ground and all output traces for optimum performance. Voltage loss due to trace resistance between the LM49450 and the load results in decreased output power and efficiency. Trace resistance between the power supply and ground has the same effect as a poorly regulated supply, increased ripple and reduced peak output power. Use wide traces for power supply inputs and amplifier outputs to minimize losses due to trace resistance, as well as route heat away from the device. Proper grounding improves audio performance, minimizes crosstalk between channels and prevents switching noise from interfering with the audio signal. Use of power and ground planes is recommended.

Place all digital components and route digital signal traces as far as possible from analog components and traces. Do not run digital and analog traces in parallel on the same PCB layer. If digital and analog signal lines must cross either over or under each other, ensure that they cross in a perpendicular fashion.

Exposed DAP Mounting Considerations

The LM49450 WQFN package features an exposed die-attach (thermal) pad on its backside. The exposed pad provides a direct heat conduction path from the die to the PCB, reducing the thermal resistance of the package. Connect the exposed pad to GND with a large pad and via to a large GND plane on the bottom of the PCB for best heat distribution.

Revision Table

Rev	Date	Description
1.0	12/18/07	Initial release.
1.01	09/26/08	Corrected the package drawing.
1.02	08/04/11	On Table 5 (Common DAC Clock..., col DAC MODE = 2b01... sample 8...), changed 2.084 to 2.048.
D	05/03/13	Changed layout of National Data Sheet to TI format.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish	MSL Peak Temp (3)	Op Temp (°C)	Top-Side Markings (4)	Samples
LM49450SQ/NOPB	ACTIVE	WQFN	RTV	32	1000	Green (RoHS & no Sb/Br)	CU SN	Level-1-260C-UNLIM	-40 to 85	L49450	Samples
LM49450SQX/NOPB	ACTIVE	WQFN	RTV	32	4500	Green (RoHS & no Sb/Br)	CU SN	Level-1-260C-UNLIM	-40 to 85	L49450	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as “components”) are sold subject to TI’s terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI’s terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers’ products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers’ products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI’s goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or “enhanced plastic” are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have ***not*** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
