

## SN65LVDS822 Flatlink™ LVDS Receiver

### 1 Features

- 4:27 LVDS-to-CMOS Deserializer
- Pixel Clock Range of 4 MHz to 54 MHz, for Resolutions of 160 × 120 to 1024 × 600
- Special 2:27 Mode With 14x Sampling Allows Using Just Two Data Lanes
- Very Low EMI With 3-Way Selectable CMOS Slew Rate
- Supports Single 3.3-V Power Supply;  $V_{DDIO}$  Allows 1.8 V to 3.3 V for Flexible Panel Support
- Clock Output is Rising or Falling Edge
- Bus-Swap Feature for Flexible PCB Layout
- Integrated Switchable Input Termination
- All Input Pins are Failsafe;  $\pm 3$  kV HBM ESD Protection
- 7-mm x 7-mm 48-Pin VQFN With 0.5-mm Pitch
- Compatible With TIA/EIA-644-A Transmitters

### 2 Applications

- Printers
- Appliances With an LCD
- Digital Cameras

### 3 Description

The SN65LVDS822 is an advanced FlatLink™ low-voltage differential signal (LVDS) receiver designed on a modern CMOS process. The device has several unique features, including three selectable CMOS output slew rates, CMOS output voltage support of 1.8 V to 3.3 V, a pinout swap option, integrated differential termination (configurable), an automatic low-power mode, and deserialization modes of 4:27 and 2:27. The device is compatible with TI FlatLink™ transmitters such as the SN75LVDS83B, SN65LVDS93A, and standard industry LVDS transmitters that comply with TIA/EIA 644-A.

The SN65LVDS822 features an automatic low-power Standby Mode, activated when the LVDS clock is disabled. The device enters an even lower-power Shutdown Mode with a low voltage applied to pin SHTDN#.

The SN65LVDS822 is packaged in a 48-pin 7-mm x 7-mm Plastic Quad Flatpack No-Lead (QFN) with a 0.5-mm pin pitch, and operates through an industrial ambient temperature range of  $-40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$ .

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
SN65LVDS822	VQFN (48)	7.00 mm x 7.00 mm

(1) For all available packages, see the orderable addendum at the end of the datasheet.

## 5 Description (Continued)

A clock frequency range of 4 MHz to 54 MHz is supported in the standard 7x mode, which is to be used with LVDS data rates of 28 Mbps to 378 Mbps. The 14x mode supports 4 MHz to 27 MHz, for LVDS data rates of 56Mbps to 378 Mbps. The LVDS clock frequency always matches the CMOS output clock frequency. DC common mode voltage is monitored on clock line for normal operation. The device is designed to support resolutions as low as 1/16th VGA (160 × 120), and as high as 1024 × 600, with 60 frames per second and 24-bit color.

The SN65LVDS822 features an automatic low-power standby mode, activated when the LVDS clock is disabled. The device enters an even lower-power shutdown mode with a low voltage applied to pin SHTDN#. In both low-power modes, all CMOS outputs drive low. All input pins have fail-safe protection that prevents damage from occurring before power supply voltages are high and stable.

The SN65LVDS822 is packaged in a 48-pin 7-mm x 7-mm Plastic Quad Flatpack No-Lead (QFN) with a 0.5-mm pin pitch, and operates through an industrial ambient temperature range of –40°C to 85°C.

## 6 Pin Configuration and Functions

**SN65LVDS822**

SLLSEE8B – SEPTEMBER 2013 – REVISED SEPTEMBER 2014

CLKOUT	41		Clock output for the data bus

**Pin Functions (continued)**

PIN		I/O	DESCRIPTION
NAME	NO.		
SWAP	45	CMOS Input	Selects the CMOS output pinout, and also controls differential input termination. Low – Default pinout, R <sub>ID</sub> connected Floating – Default pinout, R <sub>ID</sub> disconnected (requires external termination) High – Swapped pinout, R <sub>ID</sub> connected
MODE14	36		Sets the number of LVDS serial bits per lane per clock period. Low – 7 bits (see <a href="#">Figure 16</a> ) High – 14 bits; only lanes A0 and A2 are used (see <a href="#">Figure 17</a> )
CLKPOL	23		CLKOUT polarity Low – D[26:0] is valid during the CLKOUT falling edge Floating – Reserved; do not use High – D[26:0] is valid during the CLKOUT rising edge
SHTDN#	37		Shutdown Mode; Active-Low
SLEW	35		Sets the CMOS output slew rate Low – Slowest rise/fall time Floating – Medium rise/fall time High – Fastest rise/fall time
VDD	24, 44	Power Supply	Main power supply; 3.3 V
VDDIO	6, 17, 43		Power supply for CMOS outputs; 1.8 V to 3.3 V
GND	Thermal Pad		Reference Ground

## 7 Specifications

### 7.1 Absolute Maximum Ratings<sup>(1)</sup>

		MIN	MAX	UNIT
Supply voltage range <sup>(2)</sup> , V <sub>DD</sub> , V <sub>DDIO</sub>		-0.3	4	V
Voltage range at any input terminal	When V <sub>DDIO</sub> > 0 V	-0.5	4	V
Voltage range at any output terminal	When V <sub>DDIO</sub> ≤ 0 V	-0.5	V <sub>DDIO</sub> + 0.7	
Maximum junction temperature, T <sub>J</sub>			125	°C

- (1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under [Recommended Operating Conditions](#) is not implied. Exposure to absolute maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to the GND terminals

### 7.2 Handling Ratings

		MIN	MAX	UNIT	
T <sub>stg</sub>	Storage temperature range	-65	150	°C	
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model <sup>(1)</sup> (all pins)	-3	3	V
		Charged device model <sup>(2)</sup> (all pins)	-1.5	1.5	

- (1) In accordance with JEDEC Standard 22, Test Method A114-B
- (2) In accordance with JEDEC Standard 22, Test Method C101

### 7.3 Recommended Operating Conditions

		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V <sub>DD</sub>	Main power supply		3	3.3	3.6	V
V <sub>DDIO</sub>	Power supply for CMOS outputs		1.65		3.6	V
V <sub>NOISE</sub>	Power supply noise (peak-to-peak)	f <sub>NOISE</sub> < 1 MHz			100	mV
		f <sub>NOISE</sub> > 1 MHz			50	
T <sub>A</sub>	Operating free-air temperature		-40		85	°C
T <sub>C</sub>	Case temperature				98	°C
<b>LVDS CLOCK (CLKP, CLKN)</b>						
f <sub>CLK</sub>	LVDS clock frequency	MODE14 = Low	4		54	MHz
		MODE14 = High	4		27	
		Standby Mode			0.5	
t <sub>DC</sub>	LVDS clock duty cycle	MODE14 = Low		57%		
		MODE14 = High		50%		
<b>LVDS INPUTS (A0P, A0N, A1P, A1N, A2P, A2N, A3P, A3N, CLKP, CLKN)</b>						
V <sub>ID</sub>	Input differential voltage <sup>(1)</sup>	V <sub>AXP</sub> - V <sub>AXN</sub>   and  V <sub>CLKP</sub> - V <sub>CLKN</sub>	90		600	mV
ΔV <sub>ID</sub>	Input differential voltage variation between lanes		-10%		10%	
V <sub>CM</sub>	Input common mode voltage <sup>(1)</sup>		V <sub>ID</sub>  /2		2.4 -  V <sub>ID</sub>  /2	V
ΔV <sub>CM</sub>	Input common mode voltage variation between lanes		-100		100	mV
t <sub>R/F(VID)</sub>	LVDS V <sub>ID</sub> rise/fall time <sup>(2)</sup>	MODE14 = Low	f <sub>CLK</sub> = 4 MHz to 14 MHz		3	ns
			f <sub>CLK</sub> = 14 MHz to 22 MHz		2	
			f <sub>CLK</sub> = 22 MHz to 30 MHz		1.5	
			f <sub>CLK</sub> = 30 MHz to 54 MHz		1	
		MODE14 = High	f <sub>CLK</sub> = 4 MHz to 7 MHz		3	
			f <sub>CLK</sub> = 7 MHz to 11 MHz		2	
			f <sub>CLK</sub> = 11 MHz to 15 MHz		1.5	
			f <sub>CLK</sub> = 15 MHz to 27 MHz		1	
<b>CMOS OUTPUTS (D[26:0], CLKOUT)</b>						
C <sub>L</sub>	Capacitive load on the outputs			10		pF

(1) See [Figure 1](#).

(2) See [Figure 6](#). Defined from 20% to 80% of the differential voltage transition. Faster edge rates are generally preferred, as they provide more timing margin.

## 7.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		SN65LVDS822	UNIT
		RGZ	
		48 PINS	
$\theta_{JA}$	Junction-to-ambient thermal resistance <sup>(2)</sup>	30.1	°C/W
$\theta_{JCTop}$	Junction-to-case (top) thermal resistance <sup>(3)</sup>	18.1	
$\theta_{JB}$	Junction-to-board thermal resistance <sup>(4)</sup>	6.9	
$\psi_{JT}$	Junction-to-top characterization parameter <sup>(5)</sup>	0.2	
$\psi_{JB}$	Junction-to-board characterization parameter <sup>(6)</sup>	6.9	
$\theta_{JCbott}$	Junction-to-case (bottom) thermal resistance <sup>(7)</sup>	0.7	

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).

(2) The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a JEDEC-standard, high-K board, as specified in JESD51-7, in an environment described in JESD51-2a.

(3) The junction-to-case (top) thermal resistance is obtained by simulating a cold plate test on the package top. No specific JEDEC-standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.

(4) The junction-to-board thermal resistance is obtained by simulating in an environment with a ring cold plate fixture to control the PCB temperature, as described in JESD51-8.

(5) The junction-to-top characterization parameter,  $\psi_{JT}$ , estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining  $\theta_{JA}$ , using a procedure described in JESD51-2a (sections 6 and 7).

(6) The junction-to-board characterization parameter,  $\psi_{JB}$ , estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining  $\theta_{JA}$ , using a procedure described in JESD51-2a (sections 6 and 7).

(7) The junction-to-case (bottom) thermal resistance is obtained by simulating a cold plate test on the exposed (power) pad. No specific JEDEC standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.

## 7.5 DC Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP <sup>(1)</sup>	MAX	UNIT
<b>LVDS INPUTS (A0P, A0N, A1P, A1N, A2P, A2N, A3P, A3N, CLKP, CLKN)</b>						
R <sub>ID</sub>	Differential input termination resistance <sup>(1)</sup>	SWAP = Low or High	80		132	Ω
C <sub>ID</sub>	Differential input capacitance	Measured across differential pairs		1		pF

<b>2-STATE CMOS INPUTS (MODE14, SHTDN#)</b>						
I <sub>IH</sub>	High-level input current (through pull-down)	V <sub>IN</sub> = 3.6 V			20	μA
I <sub>IL</sub>	Low-level input current	V <sub>IN</sub> = GND	0			μA
<b>CMOS OUTPUTS (D[26:0], CLKOUT)</b>						
V <sub>OH</sub>	High-level output voltage	SLEW = Low; I <sub>OH</sub> = -250 μA	0.8 x V <sub>DDIO</sub>		V <sub>DDIO</sub>	V
		SLEW = Floating; I <sub>OH</sub> = -500 μA	0.8 x V <sub>DDIO</sub>		V <sub>DDIO</sub>	
		SLEW = High; I <sub>OH</sub> = -1.33 mA	0.8 x V <sub>DDIO</sub>		V <sub>DDIO</sub>	
V <sub>OL</sub>	Low-level output voltage	SLEW = Low; I <sub>OL</sub> = 250 μA	0		0.5	V
		SLEW = Floating; I <sub>OL</sub> = 500 μA	0		0.5	
		SLEW = High; I <sub>OL</sub> = 1.33 mA	0		0.5	

 (1) When V<sub>DD</sub> = 0 V, the connection of R<sub>ID</sub> is unknown.

## 7.6 Power Supply Characteristics

over recommended operating conditions (unless otherwise noted)

PARAMETER	TEST CONDITIONS <sup>(1)(2)</sup>		TYP	MAX <sup>(1)</sup>	UNIT	
I <sub>DD</sub>	Total average supply current of V <sub>DD</sub> and V <sub>DDIO</sub>	Grayscale pattern; outputs terminated with 10 pF; MODE14 = Low, V <sub>DD</sub> = 3.3 V, V <sub>DDIO</sub> = 1.8 V	SLEW = Low; f <sub>CLK</sub> = 10 MHz	24.6		mA
		Grayscale pattern; outputs terminated with 10pF; MODE14 = Low, V <sub>DD</sub> = V <sub>DDIO</sub> = 3.3 V	SLEW = Low; f <sub>CLK</sub> = 10 MHz	25.7		
			SLEW = Float; f <sub>CLK</sub> = 20 MHz	30.9		
			SLEW = High; f <sub>CLK</sub> = 54 MHz	51.5		
		1010 pattern; outputs terminated with 10 pF; MODE14 = Low, V <sub>DD</sub> = V <sub>DDIO</sub> = 3.6 V	SLEW = Float; f <sub>CLK</sub> = 20 MHz	48.2	59	mA
			SLEW = High; f <sub>CLK</sub> = 54 MHz	101.7	124	
Standby Mode	LVDS inputs are open; CMOS inputs held static; Outputs terminated with 10 pF	f <sub>CLK</sub> < 500 kHz; V <sub>CM-CLKP/N</sub> ≤ 0.80 x V <sub>DD</sub>	4	7	mA	
		V <sub>CM-CLKP/N</sub> > 0.95 x V <sub>DD</sub>	75	130		
		SHTDN# = Low	4	20	μA	
P <sub>D</sub>	Power Dissipation	Grayscale pattern; outputs terminated with 10 pF; MODE14 = Low, V <sub>DD</sub> = 3.3 V, V <sub>DDIO</sub> = 1.8 V	SLEW = Low; f <sub>CLK</sub> = 10 MHz	83		mW
		1010 pattern; outputs terminated with 10 pF; MODE14 = Low, V <sub>DD</sub> = V <sub>DDIO</sub> = 3.6 V	SLEW = High; f <sub>CLK</sub> = 54 MHz	366	446	

 (1) Grayscale and 1010 test patterns are described by [Figure 5](#) to [Figure 6](#) and [Table 1](#) to [Table 2](#).

 (2) Standby Mode can be entered in two ways: f<sub>CLK</sub> = zero to 500 kHz, or a high V<sub>CM</sub> on the LVDS clock. If the LVDS transmitter device disables its clock driver to a high-impedance state, the SN65LVDS822's integrated R<sub>PU</sub> will pull V<sub>CM</sub> high for the lower-power Standby state.

## 7.7 Switching Characteristics

over recommended operating conditions (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP <sup>(1)</sup>	MAX	UNIT		
<b>INPUT TO OUTPUT RESPONSE TIME</b>							
$t_{PD}$	Propagation delay of data	Measured from CLK input to CLKOUT		$2.4/f_{CLK}$	s		
$t_{PWRUP}$	Enable time, exiting Shutdown	From Shutdown Mode, time from SHTDN# pulled High to valid output data (see Figure 9)		2	ms		
$t_{WAKE}$	Enable time, exiting Standby	From Standby Mode, time from when CLK input starts switching to valid output data		2	ms		
$t_{PWRDN}$	Disable time, entering Shutdown	From Active Mode, time from SHTDN# pulled Low until all outputs are static-Low		11	$\mu$ s		
$t_{STANDBY}$	Disable time, entering Standby	From Active Mode, time from CLK input stopping until all outputs are static-Low		3	$\mu$ s		
$f_{BW}$	PLL bandwidth <sup>(1)</sup>	Tested from CLK input to CLKOUT		$6\% \times f_{CLK}$	Hz		
<b>LVDS INPUTS (A0P, A0N, A1P, A1N, A2P, A2N, A3P, A3N, CLKP, CLKN)</b>

$t_{H2}$	Hold time available for the downstream receiver <sup>(5)</sup>	MODE14 = Low; $C_L = 10$ pF	SLEW = Low	$0.52/f_{CLK} - 18.2E-9$			s
			SLEW = Floating	$0.52/f_{CLK} - 9.2E-9$			
			SLEW = High	$0.52/f_{CLK} - 3.7E-9$			
		MODE14 = High; $C_L = 10$ pF	SLEW = Low	$0.45/f_{CLK} - 18.5E-9$			
			SLEW = Floating	$0.45/f_{CLK} - 9.5E-9$			
			SLEW = High	$0.45/f_{CLK} - 4E-9$			

- (1) The PLL bandwidth describes the typical highest modulation frequency that can be tracked. If the LVDS transmitter device generates a spread spectrum, the LVDS clock and data must stay synchronized throughout modulation. The SN65LVDS822 will track and pass through modulation, and the downstream CMOS receiver must be able to track it.
- (2) Receiver Input Skew Margin ( $t_{RSKM}$ ) is the timing margin available for transmitter output pulse position ( $t_{PPOS}$ ), interconnect skew, and interconnect inter-symbol interference.  $t_{RSKM}$  represents the remainder of the serial bit time not taken up by the receiver strobe uncertainty. The  $t_{RSKM}$  assumes a bit error rate better than  $10^{-12}$ .
- (3)  $t_{RSKM}$  is indirectly proportional to: internal setup and hold time uncertainty, ISI, duty cycle distortion from the front end receiver, skew mismatch between LVDS clock and data, and PLL cycle-to-cycle jitter.
- (4) LVDS input timing defined here is based on a simulated statistical analysis across process, voltage, and temperature ranges.
- (5) See Figure 3 and Figure 4.

## 9 Detailed Description

### 9.1 Overview

The SN65LVDS822 implements five low-voltage differential signal (LVDS) line receivers: 4 data lanes and 1 clock lane. The clock is internally multiplied by 7 or 14 (depending on pin MODE14), and used for sampling LVDS data. The device operates in either 4-lane 7x mode, or 2-lane 14x mode. Each input lane contains a shift register that converts serial data to parallel. 27 total bits per clock period are deserialized and presented on the CMOS output bus, along with a clock that uses either rising- or falling-edge alignment.

### 9.2 Functional Block Diagram

## 9.3 Feature Description

### 9.3.1 Unused LVDS Data Lanes

When MODE14 = Low and fewer than 4 data lanes are used, or when MODE14 = High and only 1 data lane is used, it's recommended that the unused lanes are biased with a constant differential voltage. This prevents high-frequency noise from toggling the unused receiver, which injects noise into the device. This is not a hard requirement, but it's standard best-practice, and the amount of noise varies system-to-system.

Two implementations are shown below, depending on whether the internal termination  $R_{ID}$  is connected. A reasonable choice for R1 and R2 is 5k $\Omega$ , which produce a nominal  $V_{ID}$  of 34 mV and 0.3 mA of static current. Smaller resistors increase  $V_{ID}$  and noise floor margin, as well as static current.

Figure 12. Bias When  $R_{ID}$  is Connected

Figure 13. Bias When  $R_{ID}$  is Disconnected

### 9.3.2 Tying CMOS Inputs With Resistors

The  $I_{IH}/I_{IL}$  specifications indicate that 2-state CMOS input pins have an internal pull-down that's a minimum size of 180 k $\Omega$ , and 3-state CMOS input pins have an internal pull-up and pull-down that are a minimum size of 100 k $\Omega$ .

Figure 14. 2-State CMOS Input

Figure 15. 3-State CMOS Input

CMOS inputs may be directly connected to  $V_{DD}$  or GND, or tied through a resistor. Using a resistor creates a voltage divider network, so it's important to use a small enough resistor to satisfy  $V_{IH}/V_{IL}$  at the pin, and to have voltage margin for system noise. When using a resistor, 5 k $\Omega$  or smaller is recommended. Of course, 3-state inputs may be left unconnected to select their floating pin state.

## 9.4 Device Functional Modes

### 9.4.1 Active Modes

#### 9.4.1.1 4-Lanes 7-Bit Mode

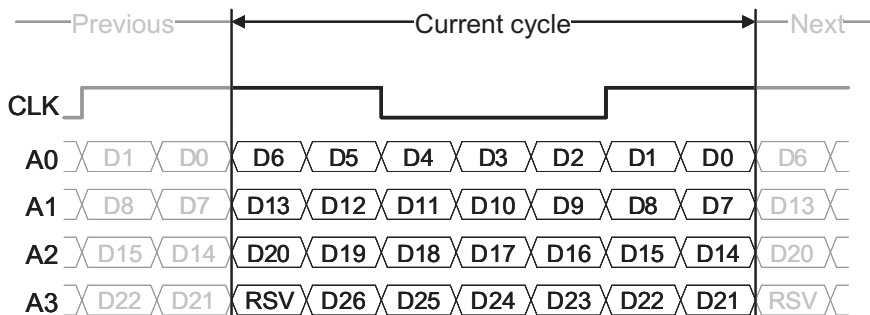

Figure 16. Data Bits Within the LVDS Stream (MODE14 = Low)

#### 9.4.1.2 2-Lanes 14-Bit Mode

Figure 17. Data Bits Within the LVDS Stream (MODE14 = High)

### 9.4.2 Low-Power Modes

#### 9.4.2.1 Standby Mode

In order to decrease the power consumption, the SN65LVDS822 automatically enters to standby when the LVDS clock is inactive.

#### 9.4.2.2 Shutdown Mode

This is the lower-power mode, and the SN65LVDS822 enters to this mode only when the SHTDN# terminal is tied to low.

#### NOTE

In both low-power modes, all CMOS outputs drive low. All input pins have failsafe protection that prevents damage from occurring before power supply voltages are high and stable.

## 10 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 10.1 Application Information

#### 10.1.1 Color Bit Mapping

The SN65LVDS822 is a simple deserializer that ignores bit representation in the LVDS stream. The CMOS output pin order was chosen so that if the color mapping within the LVDS stream matches the common VESA standard, the parallel output bus of red/green/blue fans out sequentially, which matches the order that many LCD panels require. Some LCD panels require a reversed order; for those, set pin “SWAP” high to reverse the output bus and simplify PCB routing. [Figure 19](#) shows the application setup when SWAP is in different statuses.

Any color bit mapping is supported, by correctly connecting the output to the panel. However, bit “RSV” is ignored and unavailable for use.

**Figure 18. Common VESA Color Bit Mapping**

Application Information (continued)

NOTE: NA – not applicable, these unused inputs should be left open

Figure 19. Pin Assignments With SWAP

## 10.2 Typical Application

Figure 20. Typical Application

### 10.2.1 Design Requirements

DESIGN PARAMETERS	VALUE
VDD Main Power Supply	3 - 3.6 V
VDDIO Power Supply for CMOS Outputs	1.65 - 3.6 V
Input LVDS Clock Frequency	4 - 54 MHz
RID Differential Input Termination Resistance	80 - 132 $\Omega$
LVDS Input Channels	2 or 4
Output Load Capacitance	1 pF

### 10.2.2 Detailed Design Procedure

#### 10.2.2.1 Power Supply

The implementation operates from the power provided by two banana jack connectors (P1 and P3) common ground. The VDD pin (P1) is connected to the main power supply to the SN65LVDS822 device and must be 3.3 V ( $\pm 10\%$ ). The VDDIO pin (P3) is connected to the power supply of the SN65LVDS822 CMOS outputs and must be in the range of 1.8 to 3.3 V.

#### 10.2.2.2 CMOS Output Bus Connector

*Color Bit Mapping* shows the CMOS output and bit mapping. Because some LCD panels require a reversed order, the SN65LVDS822 device is capable of reversing the output bus and simplifying PCB routing. When the pin is tied to high, the CMOS outputs are in normal order, otherwise the CMOS outputs are in reverse order.

#### 10.2.2.3 Power-Up Sequence

The SN75LVDS822 does not require a specific power up sequence.

It is permitted to power up IOVCC while VCC remains powered down and connected to GND. The input level of the SHTDN during this time does not matter as only the input stage is powered up while all other device blocks are still powered down. It is also permitted to power up all 3.3V power domains while IOVCC is still powered down to GND. The device will not suffer damage. However, in this case, all the I/Os are detected as logic HIGH, regardless of their true input voltage level. Hence, connecting SHTDN to GND will still be interpreted as a logic HIGH; the LVDS output stage will turn on. The power consumption in this condition is significantly higher than standby mode, but still lower than normal mode. The user experience can be impacted by the way a system powers up and powers down an LCD screen. The following sequence is recommended:

Power up sequence (SN75LVDS83B SHTDN input initially low):

1. Ramp up LCD power and SN65LVDS822 (maybe 0.5ms to 10ms) but keep backlight turned off.

2. Wait for additional 0-200ms to ensure display noise won't occur.
3. Enable video source output; start sending black video data.
4. Toggle LVDS83B shutdown to SHTDN = VIH.
5. Toggle LVDS822 shutdown to SHTDN = VIH.
6. Send > 1 ms of black video data; this allows the LVDS83B to be phase locked, and the display to show black data first.
7. Start sending true image data.
8. Enable backlight.

Power Down sequence (SN75LVDS83B SHTDN input initially high):

1. Disable LCD backlight; wait for the minimum time specified in the LCD data sheet for the backlight to go low.
2. Video source output data switch from active video data to black image data (all visible pixel turn black); drive this for > 2 frame times.
3. Set SN75LVDS83B input SHTDN = GND; wait for 250 ns.
4. Set SN75LVDS822 input SHTDN = GND; wait for 250 ns.
5. Disable the video output of the video source.
6. Remove power from the LCD panel for lowest system power.

### 10.2.3 Application Curve

**Figure 21. Total Current Consumption (VDD & VDDIO)**

## 11 Power Supply Recommendations

### 11.1 Decoupling Capacitor Recommendations

To minimize the power supply noise floor, provide good decoupling near the SN65LVDS822 power pins. It is recommended to place one 0.01- $\mu$ F ceramic capacitor at each power pin, and two 0.1- $\mu$ F ceramic capacitors on each power node. The distance between the SN65LVDS822 and capacitors should be minimized to reduce loop inductance and provide optimal noise filtering. Placing the capacitor underneath the SN65LVDS822 on the bottom of the PCB is often a good choice. A 100-pF ceramic capacitor can be put at each power pin to optimize the EMI performance.

## 12 Layout

### 12.1 Layout Guidelines

Use 45 degree bends (chamfered corners), instead of right-angle (90°) bends. Right-angle bends increase the effective trace width, which changes the differential trace impedance creating large discontinuities. A 45o bends is seen as a smaller discontinuity.

Place passive components within the signal path, such as source-matching resistors or ac-coupling capacitors, next to each other. Routing as in case a) creates wider trace spacing than in b), the resulting discontinuity, however, is limited to a far narrower area.

When routing traces next to a via or between an array of vias, make sure that the via clearance section does not interrupt the path of the return current on the ground plane below.

Avoid metal layers and traces underneath or between the pads off the DisplayPort connectors for better impedance matching. Otherwise they will cause the differential impedance to drop below 75  $\Omega$  and fail the board during TDR testing.

Use solid power and ground planes for 100  $\Omega$  impedance control and minimum power noise.

For a multilayer PCB, it is recommended to keep one common GND layer underneath the device and connect all ground terminals directly to this plane. For 100  $\Omega$  differential impedance, use the smallest trace spacing possible, which is usually specified by the PCB vendor.

Keep the trace length as short as possible to minimize attenuation.

Place bulk capacitors (i.e. 10  $\mu$ F) close to power sources, such as voltage regulators or where the power is supplied to the PCB.

## 13 Device and Documentation Support

### 13.1 Trademarks

FlatLink is a trademark of Texas Instruments.  
All other trademarks are the property of their respective owners.

### 13.2 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

### 13.3 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 14 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
SN65LVDS822RGZR	ACTIVE	VQFN	RGZ	48	2500	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	-40 to 85	LVDS822	Samples

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PLASTIC QUAD FLATPACK NO-LEAD

4204101/F 06/11

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. Quad Flatpack, No-leads (QFN) package configuration.
  - D. The package thermal pad must be soldered to the board for thermal and mechanical performance.
  - E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
  - F. Falls within JEDEC MO-220.

**THERMAL INFORMATION**

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
